MRloA Discloses Data Breach Affecting 134,000 People

By [Ionut Arghire](#) on January 11, 2022

Medical Review Institute of America (MRloA) on Friday started notifying some individuals that their personal information was compromised in a cyberattack.

The incident, MRloA says, was discovered on November 9, 2021. A couple of days later, the organization discovered that personal information was compromised in the attack and, by November 16, it had managed to retrieve it.

The investigation into the incident has revealed the theft of protected health information such as names, gender, physical and email addresses, phone numbers, birth dates, Social Security numbers, full clinical information (including diagnosis, treatment, medical history, and lab test results), and financial information (such as health insurance policy and group plan number).

MRloA says it has taken steps to strengthen its security. It has implemented additional multifactor authentication protections, replaced its servers with new ones and deployed a hardened backup environment, revised its cybersecurity policies, and enhanced employee training.

In a data breach notification submitted to the Maine Attorney General's Office, MRloA said that over 134,000 individuals were [impacted](#) by the incident.

The organization has not shared any information on the type of cyberattack it fell victim to. However, it did say that, immediately after the incident, it "took steps to secure and safely restore

its systems and operations,” which suggests that ransomware might have been involved.

Furthermore, the organization said it “retrieved and subsequently confirmed the deletion of” the stolen data, which suggests that MRloA contacted the attackers and negotiated with them.

SecurityWeek has emailed MRloA to confirm that ransomware was indeed involved in the incident and to ask whether a ransom was paid, but has yet to receive a response.
